Math Camp: Lesson 2.5

Introduction to R

UW-Madison Political Science

August 31, 2021

What is R?

R is...

R is...

- a programming language and software environment for statistical computing and graphics
- open source (free!)
- based on the popular C programming language

R in political science research

R in political science research

- R graphics are often featured in research in the top political science journals
- Check out Kastellec and Leoni's 2007 *Perspectives on Politics* article, Using Graphs Instead of Tables in Political Science

Getting Started

Getting Started

- Download R (engine): pick the CRAN mirror closest to you!
- Download RStudio (car): download the free version!
- Open RStudio
- Create New Folder called sample-folder
- Go to File -> New File -> R Script
- File -> Save As -> save in sample-folder

Tips

Tips

- Attempt to write the code first before you give up and ask for help
- Google is your friend! You'll get better at Googling your R questions over time
- Work with your classmates
- Know that learning R is much more about building confidence than it is about being super good at statistics

Set Working Directory

- Copy folder path
- When you use the here package, you won't have to worry about this step but for the sake of this demo, showing you this manually could help

Set Working Directory

- Copy folder path
- When you use the here package, you won't have to worry about this step but for the sake of this demo, showing you this manually could help
- In MacOS

setwd("/Users/marcyshieh/Desktop/sample-folder")

Set Working Directory

- Copy folder path
- When you use the here package, you won't have to worry about this step but for the sake of this demo, showing you this manually could help
- In MacOS

setwd("/Users/marcyshieh/Desktop/sample-folder")

In Windows

setwd("C:/Users/marcyshieh/Desktop/sample-folder")

Use R as a Calculator

Use R as a Calculator

- 1+3
- 5-3
- 2*2
- 9/9
- 2^2
- sqrt(4)

What does it mean to create an object in R?

What does it mean to create an object in R?

You are basically putting stuff in a box, then labeling the box.

What does it mean to create an object in R?

You are basically putting stuff in a box, then labeling the box.

You want to put 1 + 3 into an object called "four"

```
four <- 1+3
```

What does it mean to create an object in R?

You are basically putting stuff in a box, then labeling the box.

You want to put 1 + 3 into an object called "four"

```
four <- 1+3
```

• Now when you want to perform a function on "four," you will be referring to 1 + 3

```
sqrt(four)
```

What does it mean to create an object in R?

You are basically putting stuff in a box, then labeling the box.

You want to put 1 + 3 into an object called "four"

```
four <- 1+3
```

• Now when you want to perform a function on "four," you will be referring to 1 + 3

```
sqrt(four)
```

You want to put the word "hi" into an object called "hello"

```
hello <- "hi"
```

What does it mean to create an object in R?

You are basically putting stuff in a box, then labeling the box.

You want to put 1 + 3 into an object called "four"

```
four <- 1+3
```

• Now when you want to perform a function on "four," you will be referring to 1 + 3

```
sqrt(four)
```

You want to put the word "hi" into an object called "hello"

```
hello <- "hi"
```

- You can overwrite objects
- Here, you are taking out the word "hi" from the "hello" object and replacing it with "hi, nice to meet you"

What does it mean to create an object in R?

You are basically putting stuff in a box, then labeling the box.

You want to put 1 + 3 into an object called "four"

```
four <- 1+3
```

• Now when you want to perform a function on "four," you will be referring to 1 + 3

```
sqrt(four)
```

You want to put the word "hi" into an object called "hello"

```
hello <- "hi"
```

- You can overwrite objects
- Here, you are taking out the word "hi" from the "hello" object and replacing it with "hi, nice to meet you"

```
hello <- "hi, nice to meet you"
```

A data frame is essentially a table.

A data frame is essentially a table.

• Create a column called "streaming"

```
streaming <- c("Netflix", "Hulu", "Amazon Prime")</pre>
```

A data frame is essentially a table.

• Create a column called "streaming"

```
streaming <- c("Netflix", "Hulu", "Amazon Prime")</pre>
```

• Create a column called "approve"

```
approve <- c(50, 30, 15)
```

A data frame is essentially a table.

Create a column called "streaming"

```
streaming <- c("Netflix", "Hulu", "Amazon Prime")</pre>
```

Create a column called "approve"

```
approve <- c(50, 30, 15)
```

Create a column named "disapprove"

```
disapprove <- c(50, 70, 85)
```

A data frame is essentially a table.

Create a column called "streaming"

```
streaming <- c("Netflix", "Hulu", "Amazon Prime")</pre>
```

Create a column called "approve"

```
approve <- c(50, 30, 15)
```

Create a column named "disapprove"

```
disapprove <- c(50, 70, 85)
```

• Put all the columns together to create one table

```
streaming_dataframe <- data.frame(streaming, approve, disapprove)</pre>
```

A data frame is essentially a table.

Create a column called "streaming"

```
streaming <- c("Netflix", "Hulu", "Amazon Prime")</pre>
```

Create a column called "approve"

```
approve <- c(50, 30, 15)
```

Create a column named "disapprove"

```
disapprove <- c(50, 70, 85)
```

• Put all the columns together to create one table

```
streaming_dataframe <- data.frame(streaming, approve, disapprove)</pre>
```

• Then you can take a look at the table that you created!

```
streaming_dataframe
```

• Calculate the mean for the "approve" column

mean(streaming_dataframe\$approve)

• Calculate the mean for the "approve" column

mean(streaming_dataframe\$approve)

Calculate the mean for the "disapprove" column

mean(streaming_dataframe\$disapprove)

• Calculate the mean for the "approve" column

mean(streaming_dataframe\$approve)

Calculate the mean for the "disapprove" column

mean(streaming_dataframe\$disapprove)

• Subtract the means in the approve and disapprove columns

mean(streaming_dataframe\$approve) - mean(streaming_dataframe\$disapprove)

Summarize the Data Frame (cont)

Summarize the Data Frame (cont)

• Find the absolute value from subtracting the approve and disapprove columns

abs(mean(streaming_dataframe\$approve) - mean(streaming_dataframe\$disapprove))

Summarize the Data Frame (cont)

• Find the absolute value from subtracting the approve and disapprove columns

```
abs(mean(streaming_dataframe$approve) - mean(streaming_dataframe$disapprove))
```

Find the median of the approve column

median(streaming_dataframe\$approve)

Summarize the Data Frame (cont)

Find the absolute value from subtracting the approve and disapprove columns

```
abs(mean(streaming_dataframe$approve) - mean(streaming_dataframe$disapprove))
```

Find the median of the approve column

```
median(streaming_dataframe$approve)
```

Look at the summary statistics for the entire table

```
summary(streaming_dataframe)
```

Count rows and columns

• Count the number of rows

nrow(streaming_dataframe)

Count rows and columns

Count the number of rows

nrow(streaming_dataframe)

Count the number of variables

ncol(streaming_dataframe)

Count rows and columns

Count the number of rows

nrow(streaming_dataframe)

Count the number of variables

ncol(streaming_dataframe)

Count rows and columns

dim(streaming_dataframe)

Write csv file into folder

```
write.csv(streaming_dataframe, "streaming_dataframe.csv")
```

Write csv file into folder

```
write.csv(streaming_dataframe, "streaming_dataframe.csv")
```

• Open up your streaming_dataframe.csv file and rename the "approve" column (in Excel or a text editor) into "approve2"

```
streaming_dataframe_v2 <- read.csv("streaming_dataframe.csv")</pre>
```

Write csv file into folder

```
write.csv(streaming_dataframe, "streaming_dataframe.csv")
```

• Open up your streaming_dataframe.csv file and rename the "approve" column (in Excel or a text editor) into "approve2"

```
streaming_dataframe_v2 <- read.csv("streaming_dataframe.csv")</pre>
```

Find the mean for each column one by one

```
mean(streaming_dataframe_v2$approve2) mean(streaming_dataframe_v2$disapprove)
```

Write csv file into folder

```
write.csv(streaming_dataframe, "streaming_dataframe.csv")
```

• Open up your streaming_dataframe.csv file and rename the "approve" column (in Excel or a text editor) into "approve2"

```
streaming_dataframe_v2 <- read.csv("streaming_dataframe.csv")</pre>
```

Find the mean for each column one by one

```
mean(streaming_dataframe_v2$approve2) mean(streaming_dataframe_v2$disapprove)
```

Or find "summary" statistics info for all the columns

```
summary(streaming_dataframe_v2)
```

Graphs

Create a graph for approval

```
barplot(streaming_dataframe_v2$approve, xlab="Streaming", ylab="Approval
Rating", names.arg=c("Netflix", "Hulu", "Amazon Prime"))
```

• Create a graph for disapproval

```
barplot(streaming_dataframe_v2$disapprove, xlab="Streaming",
ylab="Disapproval Rating", names.arg=c("Netflix", "Hulu", "Amazon Prime"))
```

Install Packages

• Install the package once

```
install.packages("ggplot2")
```

Access the package in your current environment

```
library("ggplot2")
```

Create graph in ggplot2

· Create graph

```
streaming_graph<-ggplot(data=streaming_dataframe_v2, aes(x=streaming,
y=approve)) + geom_bar(stat="identity")</pre>
```

Load graph

```
streaming_graph
```

Add color to the graph

```
streaming_graph_blue<-ggplot(data=streaming_dataframe_v2, aes(x=streaming,
y=approve)) + geom_bar(stat="identity", fill="steelblue")</pre>
```

Load graph with color

```
streaming_graph_blue
```

Knit a practice R Markdown file!

Knit a practice R Markdown file!

- 1. Download LaTeX.
- 2. Go to RStudio.
- 3. Go to File > R Markdown
- 4. The "New to R Markdown" window will come up.
- 5. Enter a title for your file (e.g., Practice R Markdown Document).
- 6. Select PDF as the output format.
- 7. Save As "practice.Rmd".
- 8. Click "Knit".
- 9. Compare the PDF to the Rmd file.
- 10. Check out the R Markdown Cheatsheet.

Final Takeaways

Final Takeaways

- Coding is all about building confidence
- Don't be discouraged
- Don't be afraid to ask for help
- Rely on Google! Use it like it's a friend!
- swirl is a good resource for learning R

Let's call it a day

Homework is online
